VPRO Skills EduTech - Hybrid RAG Sample PDF

Hybrid RAG combines keyword search (BM25) and semantic search (embeddings). ChromaDB stores vectors and metadata. Sentence Transformers can generate embeddings locally. Reciprocal Rank Fusion combines ranked lists using 1 / (k + rank). BM25 can help find exact identifiers such as JWT_SECRET_KEY. Semantic search can find related passages about token signing and authentication. An OpenAI language model uses retrieved passages to produce an answer.
